

Progress Continues on Firewall

Oscar Villar and **Andrew Tran** worked to gather configuration information from routers, switches, and firewalls located at both Data Center 3 and Data Center 4. This information was requested by Fortinet so that they can develop a solution to the asymmetric routing issue. CFISD's initial design between Data Center 3 and Data Center 4 is to have both data centers online and active at the same time. Fortinet is currently developing a feature to be released in the near future that will allow CFISD to achieve the original asymmetric design.

Bond Goal 2 Network Infrastructure Upgrade
