

# Digital Sandbox – Proposed Software To Be Used by the Police Department

On **February 13, 2018**, Frankie Jackson, along with Larry Barrios and Jennifer Miller, participated in a demonstration of a product called Digital Sandbox. Ian Feldman from the City of Houston made the presentation. The Digital Sandbox is a critical infrastructure catalog that supports risk modeling, pre-incident planning and real-time situational awareness. The system is web-based making it accessible in the field. The mission of the product is to assist jurisdictions and asset owners in the Houston region with identifying their critical infrastructure and key facilities and taking steps to protect that infrastructure from terrorism and other threats and hazards.

There isn't a cost associated with the software because it is purchased as part of a grant with the City of Houston. The next step is to assess the amount of time it will take to populate the software with floor plans and data, and to potentially interface the software with other systems that could provide data.
