

CypherSecurity eLock360 Proof of Concept is Up and Running

Frankie Jackson, Jennifer Miller, Eric Pina, and Luis Velez met with representatives from CypherSecurity on **January 11, 2018**. The purpose of the meeting was to install CypherSecurity's eLock360 product and receive training. In December 2017, we approved the CypherSecurity eLock360 proof of concept to be installed. CypherSecurity is a company that helps districts protect their data against data and security breaches.

- Scott Crim and Kelly Hanson (CypherSecurity) worked with Luis and Eric to install and setup the system. They also called in David Deitsch to setup security checks on various areas of the network.
- Many of our technical concerns about the scalability of eLock360 were addressed.
- Scott Crim provided training. There are still some limitations on the number of data types that can be monitored as well as the need to automate data imports.
- We plan to use the proof of concept for the next 30 days. Scott plans to continue improving the software.
- In mid-February, we plan to regroup and determine if a plan for implementation is viable.
