## Reboot Notification

---

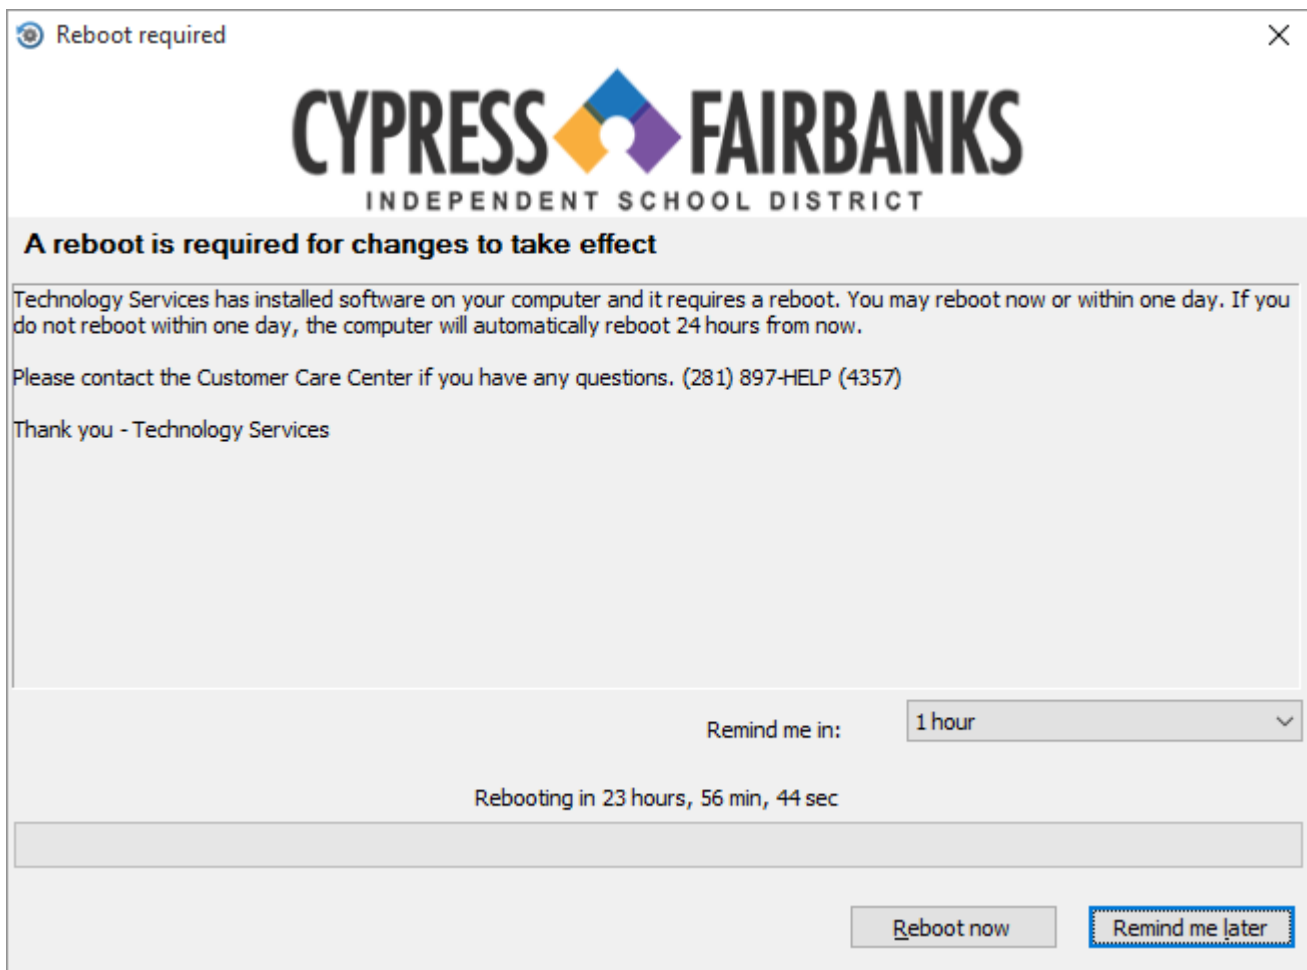

### Reboot Required

Now that the district is pushing certain critical patches and updates, customers will sometimes receive a reboot notification. This reboot notification will only appear after patches are applied that require a reboot.

Customers should choose the option to **Reboot now** option if possible. Save and close all files/programs and reboot.

Alternatively, to delay the reboot, click the dropdown box next to the **Remind me in** field. Several options for delay are available. Once an option is selected, click the **Remind me later** button. The customer can delay reboot for up to 24 hours.

**Please note: If the computer is not rebooted within 24 hours of the initial notification, it will *automatically* reboot once the 24 hours are up.**

### System Tray Icon

If the customer delays the reboot, an icon will appear in the system tray. If at any time, the customer would like to reboot, simply click on the system tray icon and the Reboot notification window will appear again. Choose the **Reboot now** button.

Alternatively, the customer may also choose the option to **Restart** from the normal Windows Start menu. A shut down is not considered the same as a reboot—the computer must be rebooted, not shut down and started up, to complete this process.
