

Active Directory Services

Lance Melancon is in the process of upgrading our Active Directory Domain Functional Level from 2008 R2 to 2012 R2. He has been working to correct any configurations necessary in order to retire the remaining two 2008 R2 domain controllers. Once the upgrade is complete, we will run the Microsoft Risk Assessment Program (RAP) which will detail any actions needed to optimize and bring our active directory services environment to full compliance. Each datacenter (Data Center 2, Data Center 3, Data Center 4) has a domain controller, as well as one in Microsoft's Azure Cloud and one in the DMZ.

This is one of many projects that will enhance our current domain functions as well as prepare for future growth.
