

Continual Improvement!

- On **Monday, July 16th**, **James Costello, Kimberly Osborn, Michael Cantu (Microsoft), Paula Ross, Greg Rhodes, and other members of the infrastructure team** met to discuss implementation of Multifactor Authentication (MFA) for Office 365. When implemented properly, MFA will help to ensure that the people logging into their email/application are the actual owner and not a cybercriminal.

- We recently performed a security health check, including a vulnerability scan on some of our systems. The results were very positive, showing that we are doing a lot to protect our systems. Any recommendations for improvement were submitted to our Information Services team and their vendors. These types of actions are performed regularly as a proactive way to ensure our employee and student data is kept safe.
