

Goal 2

# New Traffic Route for DataCenter 4

Anthony Johnson (M&S Technology), Stewart Loftis (Presidio) and **Oscar Villar**

**Lance Melancon**, **Andrew Tran** and **Oscar Villar** continued to spend a significant amount of time this week troubleshooting servers and services as a result of last week's installation of a new DMZ, new Fortinet HA Firewall pair, and new IP address space. The plan for the week was to continue to triage through applications and services that are experiencing problems, but to continue to forge ahead with additional upgrades.

Wednesday evening, **August 10, 2016**, **Oscar Villar** worked with Stewart Loftis from Presidio and Anthony Johnson from M&S Technology on the next upgrade steps. The initial step began with injecting a new data route for DataCenter 4. As of 10:00pm Wednesday evening, the changes appeared to be functioning as designed. However, during the day on Thursday we experienced numerous wireless issues and by close of business decided to back out the newly inserted route. The attempted upgrade was not a complete waste of time. Anthony Johnson was able to verify and modify firewall rules on all of CFISD Fortinet firewalls.
