

Matzke Elementary School Promethean Installation Update

There seems to be a unique power design for Promethean boards at the new Matzke ES. **Michael Raspet** visited Matzke ES to gather information regarding the Promethean board installation. The initial design specification behind the board called for 2- HDMI ports, 1 USB port with power and a 110/120V duplex outlet. The type of HDMI and USB outlets utilized in the cabling installation require power using 5V transformers and the board itself requires power. One solution is to provide a small power strip or outlet extension for the 5V transformers.
