

Retain Upgrade

COMPLETED!

Retain

Kimberly Osborn and Gwava Support completed the indexing process of the Retain upgrade. Retain archives all the district's emails and provides the platform for performing eDiscoveries.

Over 200 million messages were indexed into the new database. The old servers have been cleared for decommission, and the new Retain servers are archiving the emails in the O365 queue.

CFISD.NET Migration

Microsoft
Active Directory

Josh Zhang moved all the CFISD.NET servers from the development environment onto the production VMware cluster.

The current domain, CFISD.LOC, and CFISD.NET now exist side by side on the same network. Services integration and system migration can now begin.

For security and high availability, CFISD.NET's server footprint will be larger than the existing domain's. The next step will be to establish a trust (a data connection) between both domains so identities and other information can be exchanged.
